

MATHS BINGO

One of the activities performed during the visit of our Lithuanian Friends was a Maths Bingo. The teacher Patricia Díaz García asked the Spanish and Lithuanian students to solve problems dealing with fractions. This activity was selected due to the different levels the students had due to their different age, to encourage all the students to find a solution to every problem and to be able to win the game. The problems had different levels, from basic level (even hieroglyphs or graphic representation of fractions) to more complex problems. In addition, the problems were thought to show the Spanish culture, including references to gastronomy, monuments, etc.. Besides this, the problems were thought for the Lithuanian students to feel integrated within the activity because they included Lithuanian thypical names, Lithuanian basketball players, etc. As the problems were written in Spanish, the teacher organized mixed groups with Spanish and Lithuanian students. Therefore, the Spanish students could translate the problems into English to the Lithuanian students. There was an English teacher who helped where necessary. All the students found the activity challenging and fun. The prize was some candy for the team who shout "line!" or "bingo!"
